1. Introduction

1.1. General system description

This specification defines the design requirements for the analogue optical link to be used in the readout system of the tracker sub-detector of the CMS detector [1.1] at the CERN [1.2] Large Hadron Collider (LHC). The tracker sensing elements are silicon microstrip detectors. The approximate total number of detector channels is 10 millions, to be multiplexed and read-out by approximately 40000 optical links (plus spares). A thorough description of the CMS tracker is found in [1.3].

The CMS tracker optical readout link is embedded into the data acquisition chain shown in Fig. 1.1. It starts at the electro-optic opto- hybrid interface and ends at the opto-electric receiver module interface. Specifications for the Front End Driver board (FED), MUX and APV front-end chips can be found in: [1.4] and [1.5]

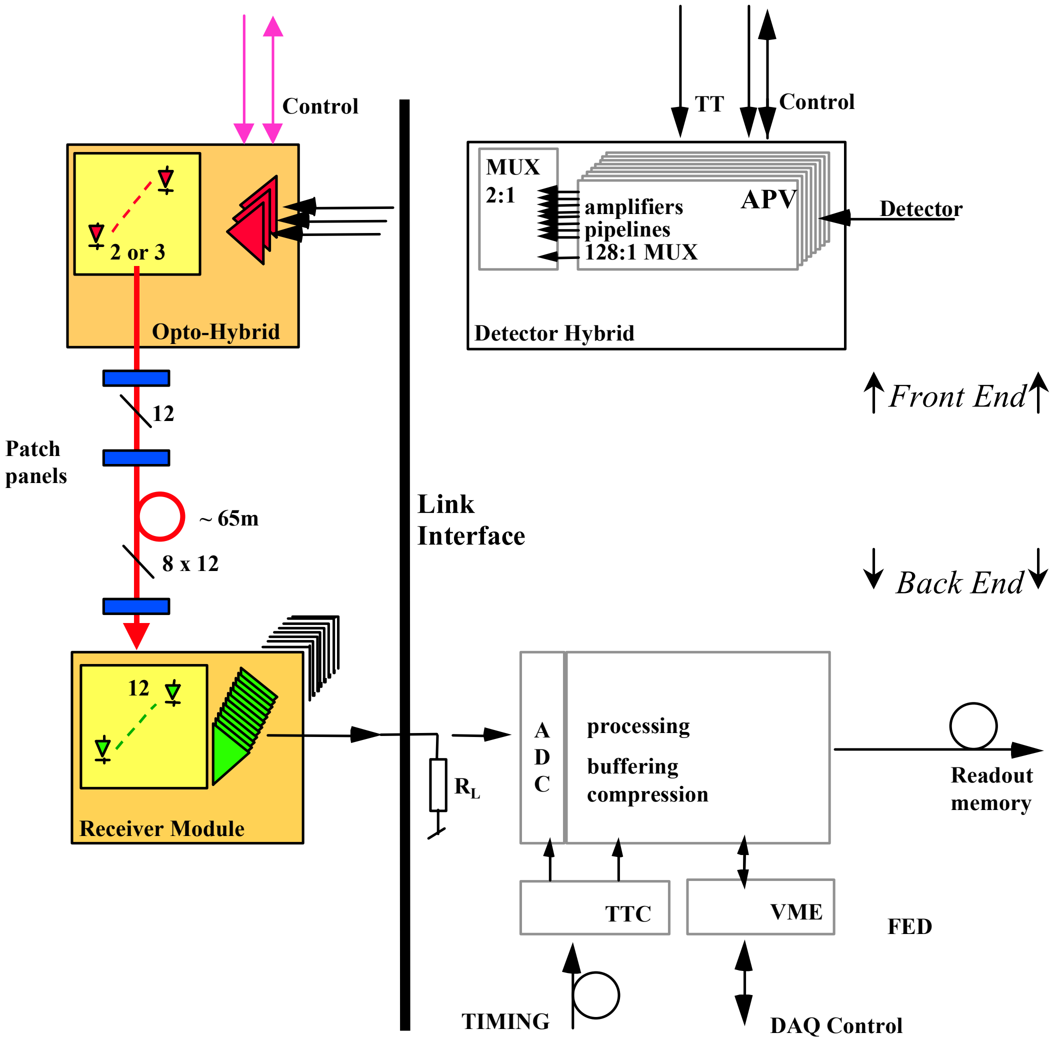

Fig. 1.1. Tracker readout chain with optical link highlighted on the left.

To ease the understanding and use of this document, a brief explanation of the CMS tracker sub-detector data flow is given below. A more detailed description of the CMS tracker readout chain can be found for instance in [1.6].
Signals from all sensor channels are sampled and stored every 25ns in the APV front-end chip analogue memory. In the event of a Level 1 trigger occurrence (TT), the analogue samples corresponding to the time slice of interest in the memory are processed, time multiplexed and transferred in packet form from the detector hybrids to the opto-transmitter hybrids via short lengths of flexible cable tape (0 to 30 cm typ.). They are then sent via optical fibres to the receivers situated at the link back-end, where they are converted back to electrical. A to D conversion, processing and buffering take place on the Front End Driver (FED) boards before the data packets are sent out to the readout memory and computer farms.

1.2. Document structure and convention

The optical link specification is broken down into eight independent parts, each describing and specifying a different level or function in the system:

Part 1. System

Part 2. Analogue Opto- Hybrid
- 2.1 Laser Driver
- 2.2 Laser Transmitter
  - 2.2.1 Terminated Pigtail
    - 2.2.1.1 Buffered Fibre
- 2.3 Analogue Opto-Hybrid Substrate

Part 3. Terminated Fibre Ribbon
- 3.1 Ruggedized Ribbon

Part 4. Terminated Multi-Ribbon Cable
- 4.1 Dense Multi-Ribbon Cable

Part 5. Analogue Opto-Receiver Module
- 5.1 Analogue Receiving Amplifier

Part 6. Distributed Patch Panel
- 6.1 MU-SR Adaptor

Part 7. In Line Patch Panel
- 7.1 Connector shell

Part 8. Backend Patch Panel
- 8.1 Connector shell

Each part has the following structure:

1. Introduction	2. Technical requirement	3. Glossary	4. References
1.1. System description	2.1. description		
1.2. Document structure	2.2. block diagram		
1.3. Related WWW sites	2.3. specification		
1.4. Contact	2.4. operating environment		
1.5. Document history	2.5. other characteristics		
	2.6. testing		
	2.7. option (when required)		

Due to the preliminary nature of this document, the specification section (section 2.3) of each system part is labelled "target specifications". CERN should be consulted before any hard- or software relying on these characteristics is being designed. Target specifications will eventually evolve into full specifications once the system definition is mature. Still to be determined parameters are labelled TBD.

1.5. Document history

Rev. 0.4, 02/08/96	Draft
Rev. 1.0, 04/09/97	Major rework, single document covering all system parts
Rev. 2.0, 05/06/98	Rework, document distributed
Rev. 3.0, 21/08/00	Document (Rev2.3) split into independent parts.
Rev. 3.1, 05/09/00	Option for single ribbon and MPO24 added.
Rev. 3.2, 21/09/00	Fibre cladding diameter tolerances decreased.
Rev. 3.3, 27/04/01	Stack option removed.

2. Technical requirement, part 3: Terminated Fibre Ribbon Cable

2.1. Description

The terminated fibre ribbon cable carries light from the distributed patch-panel (based on single fibre connectors) to the in-line patch-panel (based on multi-fibre connectors). It consists of a 12-way ribbon protected by a sheath of polyethilene and aramide yarn. Several ribbons will be routed together in cable trays over a distance of approximately 5 to 8m. On the distributed patch-panel side, each ribbon cable breaks into single fibres terminated with simplified MU connectors, plugged into 12-way adaptors. On the in-line patch-panel side, each ribbon is terminated with a MT ferrule; the final connector shell is as yet undefined.
The ruggedized ribbon is specified in part 3.1, the distributed patch-panel in part 6, and the in-line patch-panel in part 7 of the optical link technical requirement document.

Altogether, approximately 4000 cables will be required for the CMS tracker detector.

2.2. Block diagram

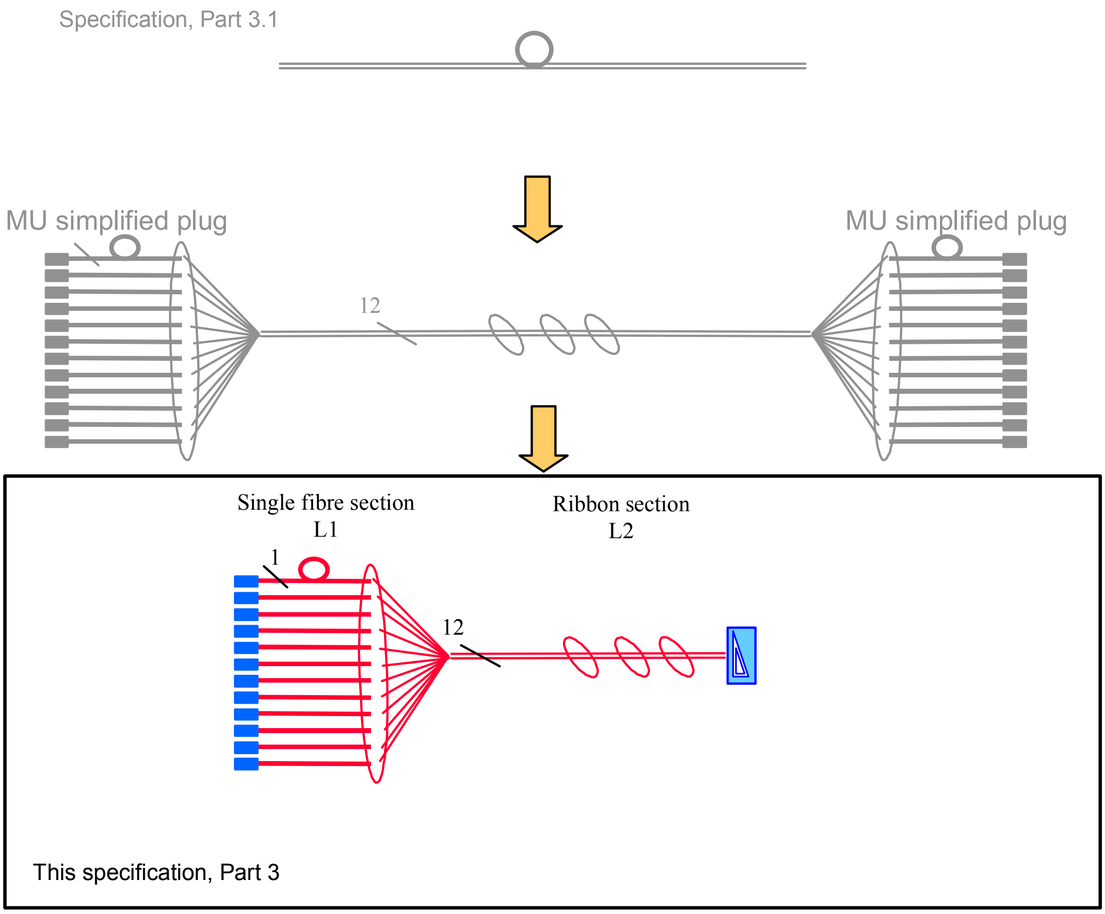

Fig. 2.1. Terminated fibre ribbon cable block diagram

2.3. Target Specifications (@25°C unless otherwise noted)

Optical fibre and ruggedized ribbon specifications are to be found in the technical requirement part 3.1.

#	**Operational specification**	min	typ	max	unit	note
3.1	Number of channels	12				
3.2	Operation Wavelength		1310		nm	
3.3	Connector type on distributed patch panel side	MU Simplified Plug				IEC 61754-6 Insertion orientation shall be marked
3.4	Number of mating cycles	20				Single fibre connector
3.5	Random mate insertion loss			0.6	dB	Single fibre connector
3.6	Random mate return loss	45			dB	Single fibre connector
3.7	Connector type on in-line patch panel side	MT12				IEC 61754-5 Option TBD
		SMC				TIA 604-14 Option TBD
		MFS				EN 186310 Option TBD
		MPO24				Option TBD
3.8	Number of mating cycles	20				Multi fibre connector
3.9	Random mate insertion loss			1.2	dB	Multi fibre connector
3.10	Random mate return loss	50			dB	Multi fibre connector
3.11	Tensile loading on connector			10	N	Operation and installation
3.12	Single fibre section length L_f	0.3	0.5	1	m	L_f to be distributed in 5 to 10 standard lengths with tolerances +20mm, -0mm. Protected by 900µm loose tube
3.13	Ribbon length Lr	3	4	6	m	L_r to be distributed in 5 to 10 standard lengths with tolerances +20mm, -0mm.
	specs 3.14 to 3.60					reserved for future use

2.4. Operating environment

#	environmental specifications	min	typ	max	unit	note
3.61	Magnetic field			4	T	parallel to any axis
3.62	Hadronic fluence[1]			3e14	$1/cm^2$	Integrated over lifetime [2] 90% charged particles 10% neutrons
3.63	Gamma radiation dose[1]			1.5e5	Gy(Si)	Integrated over lifetime [2]
3.64	Temperature	-20	-10	70	°C	Operation and storage
3.65	Operating humidity			60	%RH	13°C dew point
	specs 3.66 to 3.80					reserved for future use

[1]The component resistance to radiation will be controlled under the sole responsibility of CERN
[2]Foreseen operating lifetime: nominal 10 years.

#	safety specifications		note
3.81	Material composition	Halogen-free, flame retardant material	CERN IS41, see reference [2.2].
	specs 3.82 to 3.99		reserved for future use

2.5. Open Characteristics

- <u>single fibre connector plug</u>

fibre strain relief TBD
Plug colour TBD
Plug labelling TBD
Fibre colour code TBD

- <u>multi-fibre connector plug</u>

fibre strain relief TBD
Plug Colour TBD
Plug labelling TBD
Ribbon labelling TBD

- <u>Test Documentation and traceability</u>: TBD

- <u>Shipping and storage requirements</u>: TBD

- <u>Installation requirements</u>: TBD

2.6. Testing

2.7. Options

- Lengths Lf, Lr,

3. Glossary

This glossary is common to all parts of both the control link and the readout link specification. Some definitions may thus not be relevant to the part under consideration.

3.1. Signal to noise ratio

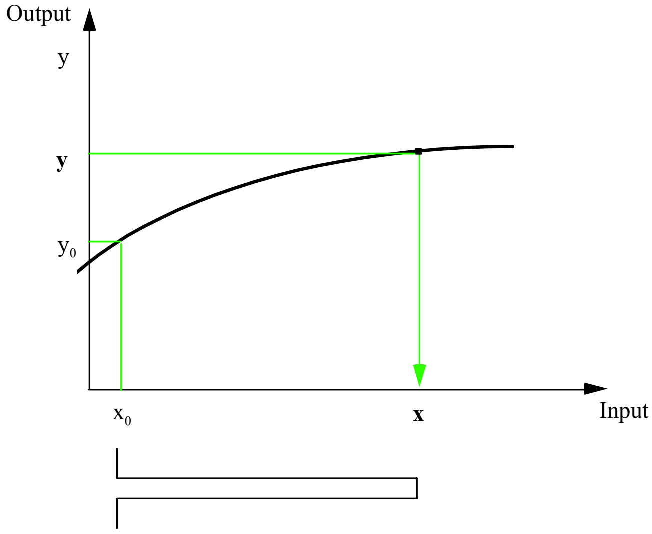

Fig. 3.1. Signal to noise ratio

The signal is defined as $\Delta y = y - y_0$, where y_0 is the system quiescent working point.

The rms noise y_{rms} is defined as the noise spectral density integrated over the full optical link bandwidth.

The signal to noise ratio (SNR) is defined as:

$$SNR = 20Log\frac{Signal}{rmsNoise} = 20Log\frac{|\Delta y|}{y_{rms}}$$

The peak signal Δy_{peak} is the largest amplitude which can be handled by the optical link in its linear operating range.

The peak signal to noise ratio (PSNR) is defined as:

$$PSNR = 20Log\frac{|\Delta y_{peak}|}{y_{rms}}$$

3.2. Integral Non-Linearity

The integral non-linearity INL is defined as the full-scale-normalized error one makes when, for a given link output signal y, the link input signal is assumed to be the linearized value x_L instead of the real value x.

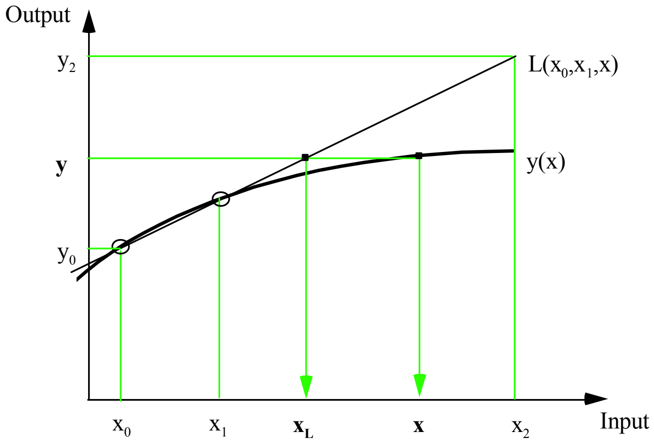

Fig. 3.2. Integral non-linearity

The linear regression is calculated by fitting the transfer characteristic in a linear operation window $]x_0, x_1]$ (alternatively $]y_0, y_1]$ in the output range) .

INL is defined as the error one makes when approximating x by x_L, normalised by the full-scale signal:

$$INL = \frac{x - x_L}{x_2 - x_0}$$

3.3. Settling time

The settling time is defined as the time required for a step response signal to settle to ±1% of its end value.

3.4. Skew

The skew is determined by measuring, for two channels, the average time $\overline{t_{50}}$ required for a step response signal to reach 50% of its end value. The skew between channels i and j is defined as:

$$t_{skew} = \overline{t_{50,\,j}} - \overline{t_{50,i}}$$

3.5. Jitter

The rms jitter is defined as the rms deviation of the time t_{50} required for a step response signal to reach 50% of its end value:

$$t_{jitter} = \sqrt{(t_{50} - \overline{t_{50}})^2}$$

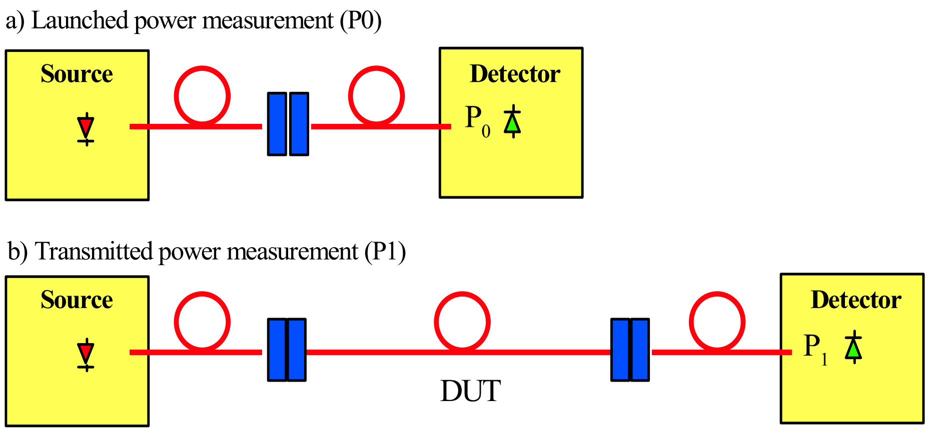
3.6. Crosstalk

The crosstalk between two channels i and j is defined as the relative feedthrough from channel i to channel j at sampling time t_s=20ns when an ideal step signal is injected into channel i at t=0s.

$$\text{Crosstalk} = 20\,\text{Log}\left|\frac{\text{Out}_j}{\text{Out}_i}\right|_{t_s=20\,\text{ns}}$$

3.7. Insertion loss

The insertion loss (IL) is defined as the Log of the ratio of optical powers measured before (P0) and after (P1) insertion of the device under test (DUT). In case the DUT is a single connector, optical power (P0 and P1) is measured with a large area detector in a receptacle.



c) Insertion loss: $\mathrm{IL} = 10\mathrm{Log}\frac{\mathrm{P}_0}{\mathrm{P}_1}$

3.8. Power supply rejection ratio

The power supply rejection ratio (PSRR) is defined as the amplitude of a sinusoidal disturbance Δd injected into the power supply rail and causing a ripple Δy on the output of the device under test, divided by the input signal Δx which would cause an identical ripple Δy .

$$PSRR = 20Log\frac{\Delta d}{\Delta x}$$
